Report Overview

The Bi-Level Sleep Ventilator is a medical device used in the treatment sleep-related breathing disorders, such as sleep apnea. It provides respiratory support by delivering two different levels of air pressure - a higher pressure during inhalation and a lower pressure during exhalation. This dual pressure system helps to alleviate breathing difficulties by ensuring that the airways remain open and free from obstructions throughout the breathing cycle. Bi-Level Sleep Ventilators offer greater comfort and adaptability for individuals who may require different levels of pressure while sleeping. The device can be tailored to suit individual needs, making it an effective and popular option for managing sleep-related breathing disorders and improving overall respiratory function during sleep.
