Abstracts

A bi-metallic rivet is an electrical contact component made from two different metal materials, typically combining a highly conductive contact layer with a cost-effective or mechanically strong base metal. These rivets are widely used in electrical switches, relays, circuit breakers, and contactors to optimize conductivity, durability, and cost efficiency. The contact surface is usually composed of silver or a silver-based alloy (such as AgCdO, AgSnO₂, or AgNi), ensuring excellent electrical performance and resistance to arc erosion, while the base metal—often copper or brass—provides structural support and reduces material costs. This layered structure allows bi-metallic rivets to maintain high electrical efficiency while enhancing mechanical stability and reducing the overall use of expensive precious metals.

The global Bi-Metallic Rivet market size was estimated at USD 823.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
