## Abstracts

A bicycle brake lever is a crucial component of the braking system, designed to enable the rider to slow down or stop the bicycle. Typically mounted on the handlebars, the brake lever is operated by squeezing it towards the handlebars. This action engages the brake mechanism, which either tightens the brake pads against the wheel rims or activates disc brakes, depending on the type of braking system. Brake levers are engineered for comfort and control, offering adjustable reach settings to accommodate different hand sizes and ensure optimal braking performance.
