## Abstracts

The bicycle self-locking pedal, also known as a clipless pedal, is a specialized cycling component designed to securely attach the rider's shoe to the pedal via a cleat mechanism, enabling a more efficient transfer of power throughout the entire pedal stroke by allowing both downward and upward force application. Unlike traditional platform pedals, these systems require a specific compatible cleat mounted to the sole of cycling shoes, which engages with the pedal's retention mechanism to lock the foot in place; disengagement is achieved through a twisting motion of the heel outward, providing both safety and performance benefits by preventing accidental foot slippage and improving pedaling biomechanics. These pedals are predominantly used by road cyclists, mountain bikers, and indoor cycling enthusiasts seeking enhanced control, stability, and energy efficiency, with variations including float adjustment for knee alignment, tension customization for release ease, and dual-sided or single-sided entry designs catering to different disciplines and user preferences.

The global Bicycle Self Locking Pedal market size was estimated at USD 2150.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
