Report Overview:

A barbed suture is a type of knotless surgical suture that has barbs on its surface. While suturing tissue, these barbs penetrate inside the tissue and lock them into place, eliminating the need for knots to tie the suture. Conventional sutures rely on a surgeon's ability to tie secure knots; barbed sutures provide a knotless alternative in some surgical situations. Barbed sutures are primarily used in cosmetic surgery. Bi-directional is a double-armed suture. Barbs reverse direction at the mid-point of the suture.

The Global Bidirectional Barbed Suture Market Size was estimated at USD 190.30 million in 2023 and is projected to reach USD 346.43 million by 2029, exhibiting a CAGR of 10.50% during the forecast period.
