Abstracts

Bidirectional EV charging is exactly what it sounds like EV charging that goes two ways. Whilst with unidirectional (one-way) EV chargers, electricity flows from the electric grid into the electric vehicle, with bidirectional (two-way) EV chargers, electricity can flow both ways. Usually, EVs use chargers that enable a unidirectional flow of electricity from the grid to the vehicle for charging purposes. Bidirectional chargers, on the other hand, have the capability to facilitate a two-way flow of energy. This means that when required, the charged battery of an EV can send surplus energy back to the grid or be used to power a home or building, acting as a temporary energy storage system. This technology allows EVs to contribute to grid stability, support energy demand during peak times, and serve as distributed energy storage, ultimately enhancing the efficiency and flexibility of the power grid. Bidirectional EV charging also enables a more integrated and sustainable energy ecosystem. The Bidirectional EV Charger is currently in a stage of rapid development but has not yet been fully popularized. From a technical perspective, the system relies on bidirectional charging technology to convert the electrical energy in electric vehicle batteries into household electricity to meet daily energy conservation and emergency power supply needs. Since the launch of the first commercial V2H system in Japan in 2012, the technology has gradually expanded in the Japanese, European and North American markets, but the overall market size is still small. However, with the increasing popularity of electric vehicles (EVs), rising energy costs and frequent extreme weather, V2H technology has attracted more attention from consumers. Japanese companies such as Nichicon and Panasonic have taken a leading position through technological innovation and government subsidies (such as the CEV program), and are also actively promoting integration with solar energy storage systems to provide more efficient solutions for distributed energy management. However, due to high initial investment and insufficient consumer awareness, market promotion still faces certain resistance, which leaves a wide space for further

development of the industry.

The global Bidirectional EV Charger market size was estimated at USD 74.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 21.90% during the forecast period.
