Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bifidobacterium Animalis Subsp. Lactis competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Bifidobacterium animalis subsp. lactis was 6,500 tons, with an average price of US\$132/kg. Bifidobacterium animalis subsp. lactis is a probiotic belonging to the genus Bifidobacterium. It is a common probiotic in the intestines of humans and animals. It is a strictly anaerobic Gram-positive bacterium with a short rod or bifidobacterial shape. It is widely used in food, supplements and clinical applications because of its benefits to human health, especially digestive function and immune function. The upstream sources of Bifidobacterium animalis subspecies *Bifidobacterium lactis* mainly include strain preservation institutions, suppliers of basic fermentation raw materials, and suppliers of freeze-drying protectants. The stability of these upstream sources directly determines the activity and yield of the strains. Downstream applications are concentrated in infant formula, probiotic solid beverages, pet probiotic preparations, and medical food companies. Infant formula companies primarily utilize it to improve gut microbiota and enhance tolerance; pet food factories use it as an important functional strain for gut health and immune regulation; medical food companies use it in gut microbiota improvement programs for lactose-intolerant and gut-sensitive individuals; and probiotic brands use it as a foundational strain in multi-strain formulations. Downstream growth potential is significantly greater than upstream, with demand benefiting from increased awareness of gut health, upgraded pet consumption, and the continued expansion of functional infant foods. The industry is showing a trend towards high activity, strong acid resistance, strong bile salt resistance, and multifunctional synergy. New fermentation processes and freeze-drying technologies are continuously improving the viable count

and stability of strains. The driving forces stem from increased consumer awareness of gut microbiota regulation, the upgrading of functional bacteria due to stricter regulations on infant formula, the booming growth of pet probiotics, and the continuously strengthening scientific evidence on the health benefits of probiotics both domestically and internationally. The main obstacles are high patent barriers for bacterial strains, with some core strains controlled by large international companies; stringent requirements for sterile environments and sophisticated fermentation equipment in the production process; and strict regulations in some countries regarding the amount of probiotics added, labeling, and efficacy claims. For freeze-dried powder products with an annual production line capacity of approximately 50-150 tons, the gross profit margin is generally between 35% and 55%.

The global *Bifidobacterium Animalis* Subsp. *Lactis* market size was estimated at USD 858.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
