Abstracts

Bifocal lenses are eyeglass lenses designed with two distinct focal areas to correct both nearsightedness and farsightedness. The lens is typically divided into two parts: the upper section is used for distance vision, and the lower section is used for near vision (such as reading), with a visible dividing line between the two. The lower part, known as the "reading area," allows the wearer to see close-up objects clearly, while the upper part provides optimal vision for distance. Bifocal lenses are particularly suited for individuals who need correction for both near and far vision.
