Abstracts

A bifurcation stent is a specialized type of coronary stent designed to treat arterial bifurcations, where a main artery splits into two smaller branches, commonly seen in the coronary arteries. These bifurcation sites are challenging to treat because of the complex anatomy and risk of restenosis (re-narrowing of the artery). Bifurcation stents are used in cases where the blockage or narrowing occurs at the junction of the main artery and its branch vessels.

The global Bifurcation Stent market size was estimated at USD 1441.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.70% during the forecast period.
