Abstracts

Biliary atresia is a rare, progressive, and life-threatening congenital condition affecting infants, characterized by the obstruction or absence of the bile ducts, which leads to cholestasis, liver fibrosis, and eventual cirrhosis if untreated. The primary treatment is the Kasai portoenterostomy procedure, performed shortly after diagnosis to restore bile flow; however, even with timely intervention, many patients develop end-stage liver disease, necessitating liver transplantation as the definitive long-term solution. The market for biliary atresia treatment is thus segmented into surgical interventions, diagnostic tools, post-operative care, immunosuppressive therapies for transplant recipients, and supportive medications to manage complications such as pruritus and malnutrition. It is a highly specialized niche driven by pediatric hepatology and transplant surgery advancements, with limited pharmacological options and a focus on improving surgical outcomes, early detection methods, and long-term management to enhance patient survival and quality of life. Key stakeholders include pediatric hospitals, transplant centers, medical device manufacturers, and pharmaceutical companies developing immunosuppressants and adjuvant therapies, all operating within a framework of stringent regulatory oversight and high unmet medical need due to the rarity and severity of the disease.

The global Biliary Atresia Treatment market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
