Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Biliary Drainage Stent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A biliary drainage stent is a medical device designed to relieve bile duct obstruction and facilitate bile flow. Typically made of plastic or metal, it is implanted into the bile duct via endoscopic, percutaneous, or surgical approaches to maintain duct patency, prevent bile accumulation, and alleviate symptoms such as jaundice or cholangitis. Biliary drainage stents are commonly used for conditions like bile duct stones, strictures, or malignant compression. In 2024, global sales of biliary drainage stents reached 1,235,890 units, with an average selling price of US\$498.0 per unit. The average production capacity of a single biliary drainage stent production line is approximately 10,000 units per year, with a gross profit margin of approximately 50%?75%. The biliary drainage stent industry chain encompasses three major segments: raw materials, manufacturing, and clinical application. The upstream mainly consists of suppliers of medical-grade polyurethane, polyethylene, PTFE, silicone, and other polymer materials, as well as metal materials such as nickel-titanium alloys and stainless steel. This includes key components such as laser cutting equipment, braiding equipment, injection molding machines, coating materials, guidewires, and delivery system components, as well as aseptic packaging services. The midstream comprises biliary drainage stent manufacturers, responsible for the extrusion molding and cutting of plastic stents, laser cutting or braiding of metal stents, and the entire production process, including coating, delivery catheter system design, assembly, sterilization, and final packaging. The downstream comprises hospitals and endoscopy centers. Products are primarily used in clinical procedures such as ERCP, EUS-guided drainage, or PTBD to treat malignant biliary obstruction, benign stenosis, and postoperative complications. Demand is driven

by factors such as disease burden, hospital procurement mechanisms, and medical insurance policies, thus forming a complete biliary drainage stent value chain.

The global Biliary Drainage Stent market size was estimated at USD 615.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
