Abstracts

Bilirubin adsorption columns are specialized medical devices designed for extracorporeal blood purification, primarily used in the treatment of hyperbilirubinemia—a condition characterized by excessive bilirubin levels in the blood, often resulting from liver dysfunction, hemolytic disorders, or neonatal jaundice. These columns function through adsorption mechanisms, utilizing specific ligands or resins that selectively bind bilirubin molecules from the patient's blood during procedures like hemoperfusion or plasma perfusion, thereby reducing systemic bilirubin concentrations without significant removal of essential proteins or blood components. They are typically employed as adjunctive therapies when conventional treatments such as phototherapy or medication prove insufficient, offering a targeted approach to managing acute or chronic bilirubin overload, particularly in critical care, hepatology, and neonatal intensive care settings.

The global Bilirubin Adsorption Column market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
