## Abstracts

A bimetallic busbar is a conductive bar used to transmit electric energy, which is composed of two different metal materials through a specific process. Usually, metals with good electrical conductivity such as copper or aluminum are combined with another metal with specific properties (such as high strength, high corrosion resistance, etc.) through welding, rolling or other composite technologies to give full play to the advantages of the two metals. This composite structure can not only ensure good electrical conductivity, but also improve the mechanical strength, corrosion resistance or other specific properties of the busbar to a certain extent, so as to meet the needs of different electrical equipment and power systems in various working environments. It is often used in power equipment such as substations, switchgear, distribution boxes and power transmission lines.

The global Bimetallic Busbar market size was estimated at USD 581.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
