Abstracts

Binders for batteries are polymer-based materials that serve as adhesives to hold together the active materials, conductive additives, and other components within battery electrodes, ensuring structural integrity, electrical connectivity, and mechanical stability during charge-discharge cycles. These binders are critical in both lithium-ion and emerging battery technologies, as they influence performance metrics such as energy density, cycle life, and safety by mitigating issues like electrode cracking, delamination, or contact loss. While traditional binders like polyvinylidene fluoride (PVDF) remain widely used, advancements are driving demand for water-soluble, eco-friendly alternatives (e.g., carboxymethyl cellulose or styrene-butadiene rubber) and functional binders that enhance ionic conductivity or self-healing properties, aligning with trends toward sustainable manufacturing and higher-performance energy storage systems.

The global Binders For Batteries market size was estimated at USD 11250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
