Abstracts

Binders for silicon-based anodes are specialized polymeric materials designed to maintain the structural integrity of the anode in lithium-ion batteries by mitigating the significant volume expansion (up to 300%) that silicon experiences during lithiation and delithiation cycles; these binders must exhibit strong adhesion to silicon particles and the current collector, provide mechanical elasticity to accommodate swelling, ensure electronic and ionic conductivity, and remain chemically stable in the electrolyte environment, with common types including synthetic polymers like polyacrylic acid (PAA), carboxymethyl cellulose (CMC), and polyvinylidene fluoride (PVDF), as well as advanced water-based, conductive, or self-healing binders engineered to enhance cycling stability and capacity retention.

The global Binders For Si Based Anodes market size was estimated at USD 352.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
