## Abstracts

A binocular camera module is a compact imaging system that integrates two or more closely spaced camera sensors, often with overlapping fields of view, designed to capture stereoscopic or depth information by processing the disparity between the images from each sensor. These modules are engineered to enable depth perception, 3D reconstruction, and spatial mapping in applications such as augmented reality (AR), virtual reality (VR), robotics, autonomous navigation, facial recognition, and advanced photography. They typically incorporate synchronized image sensors, lenses with calibrated optical characteristics, and may include embedded processors or interfaces for real-time depth calculation, making them distinct from single-camera systems by their ability to provide both 2D imagery and 3D spatial data.

The global Binocular Camera Module market size was estimated at USD 1560.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.35% during the forecast period.
