Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bio Based Ethylene competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bio-Based Ethylene is ethylene whose carbon originates partly or wholly from renewable feedstocks while remaining chemically identical to fossil ethylene; it functions as a drop-in C2 building block for polyethylene, ethylene oxide/glycols, vinyls, styrenics and alpha-olefins with auditable renewable attribution. Two chain-of-custody modes dominate. First, physical segregation via bio-ethanol dehydration yields neat bio-ethylene (e.g., Braskem's Triunfo green ethylene), directly supporting bio-PE with measurable biogenic carbon. Second, mass balance at naphtha crackers attributes renewable content from bio-naphtha or bio-circular oils to ethylene and downstream polymers under ISCC PLUS, which sets site- and scope-specific bookkeeping rules for attribution and traceability. These frameworks explicitly cover Naphtha ? Ethylene within certified product groups, allowing certified transfers through the cracker-to-polymer chain. Upstream supply combines a large segregated line with multiple ISCC-certified cracker networks. Braskem expanded its Triunfo bio-ethylene capacity from 200 kt/y to 260 kt/y (July 2023) and subsequently reported operation rates above nameplate (May 2025), while independent OPIS/WSJ coverage documented a flood-related outage and restart in May 2024?together validating scale and continuity. In Europe and North America, SABIC offers certified renewable polymers produced from bio-naphtha via ISCC PLUS; TotalEnergies states all European polymer grades are available as RE:newable (ISCC PLUS bio/bio-circular feedstock); Borealis markets Bornewables across the ethylene chain, including PEX via mass balance; INEOS demonstrates bio-based HDPE projects tied to tall-oil-derived feedstock and bio-ethylene at Cologne feeding Lillo polymerization; LyondellBasell extends CirculenRenew under ISCC PLUS;

Repsol and Versalis offer bio- and bio-circular attributed olefins/polyolefins within certified Balance?/Reciclex programs. Dow integrates UPM BioVerno renewable naphtha at Terneuzen. Site-scope ISCC certifications at Formosa Plastics USA and Westlake underline North American cracker/polymer readiness for attributed chains. In the current market, global production is around 230,000 tonnes, with an average selling price of about 1,100 USD/t on an EXW basis. Concentration is structurally higher in segregated ethanol routes?Braskem supplies the bulk of directly observable bio-ethylene?while mass balance extends geographic reach through certified crackers, diffusing concentration once attributed volumes are included. Demand is anchored in polyethylene (near one-to-one incorporation to polymer), with additional pull from ethylene oxide/glycols (e.g., bio-MEG chains) and selective vinyls and styrenics allocations where certification supports claims. For 2025?2031, directional growth is supported by corporate decarbonization targets, brand procurement frameworks and broader ISCC PLUS adoption; bottlenecks include renewable feedstock availability, site-scope certification coverage, and the bio-naphtha premium vs. fossil naphtha. As with downstream PE, ISCC PLUS remains the dominant chain-of-custody mechanism, and ISO 16620-2 / ASTM D6866 radiocarbon methods underpin claims where physical segregation is used.

The global Bio Based Ethylene market size was estimated at USD 253.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
