### Report Overview:

Matting effects in coating applications have traditionally been created by means of synthetic or mineral powder particles. In many instances, such powders were made of ground polymer, i.e. finely milled plastics such as polypropylene or polyurethane. Those particles are not biodegradable and are classified as so-called “microplastics”. In recent times, many legislations (particularly in Europe and North America) have recognized the environmental damage caused by such plastic beads, which has incited innovative manufacturers to search for natural and even biodegradable alternatives.

The Global Bio-Based Matting Agent Market Size was estimated at USD 341.74 million in 2023 and is projected to reach USD 498.64 million by 2029, exhibiting a CAGR of 6.50% during the forecast period.
