Abstracts

Bio-based penetrating oil is a metal maintenance oil composed of additives and bio-based oils. It has a super-high viscosity index and excellent lubrication and corrosion resistance. Compared with traditional petroleum-based lubricants, bio-based penetrating oil has better environmental performance and biodegradability. It is a new type of environmentally friendly lubricant that has been widely used in many fields in recent years. With the continuous advancement of technology, the research and development and application of new bio-based penetrating oil products have further improved the performance and quality of products and met the diversified needs of the market. These new products not only have higher environmental performance, but also show better permeability and lubricity in specific application fields. The continuous optimization of production processes has reduced production costs, improved production efficiency and product quality. This helps bio-based penetrating oil gain greater competitive advantages in the market and promote the rapid development of its market. In addition, governments of various countries have continuously increased their attention to environmental protection and issued a series of policies and regulations aimed at reducing pollution and protecting the environment. These regulations have put forward higher requirements for the environmental performance of chemicals, and promoted the rapid development of environmentally friendly products such as bio-based penetrating oil. Downstream applications have also driven the development of bio-based penetrating oil. With the rapid development of the automobile industry and the increasing demand of consumers for environmentally friendly cars, the application scope of bio-based penetrating oil in the automotive field has continued to expand. For example, it can be used for lubrication and rust prevention of automotive parts. In the electronic manufacturing process, bio-based penetrating oil can be used in cleaning, rust prevention and lubrication processes to improve the quality and reliability of electronic products. With the continuous expansion of the electronic product market and

the accelerated replacement speed, the demand for bio-based penetrating oil in the electronic field is also growing continuously. Although the bio-based penetrating oil market has broad development prospects, it still faces some obstacles. For example, the production process of bio-based penetrating oil is relatively complicated and requires the use of high-quality raw materials, which leads to relatively high production costs. High costs may limit the market competitiveness of products and affect their promotion and application in the market. The raw materials of bio-based penetrating oil mainly come from biomass resources, such as vegetable oils, animal fats, etc. However, the supply of these raw materials is affected by many factors, such as climate, output, price, etc., resulting in unstable supply of raw materials. Although bio-based penetrating oil has advantages in environmental performance, in some application areas, its performance may not fully meet the standards of traditional petroleum-based penetrating oil. This requires companies to continuously carry out technological research and development and innovation to improve the performance and quality of products.

The global Bio-based Penetrating Oils market size was estimated at USD 1433.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
