### Report Overview

The bio-absorbable implant is chemical compounds which are designed to be absorbed by the body without eliciting the immune response. Bio-Absorbable implants are used to overcome the issues like rigidity, radiopacity, infections, growth disturbances, etc. Bio-Absorbable implants are an internal fixation of fractures, ligament injuries, arthrodesis, and osteotomies. Bio-Absorbable implants maintain fixation and decompose gradually without no stress shielding. They do not require a surgical procedure for removal. They are different types of materials are used for Bio-Absorbable implants namely polyglycolic acid, polylactic acid, polydioxanone, etc. Polyglycolic acid occurs in different forms namely poly Dextro- and polylevolactic acid. The degradation of Bio-Absorbable implants mainly occurred by hydrolytic breaking and non-specific enzymatic reactions. The degradation rate of Bio-Absorbable implants varies, a polylevolactic acid having the longer degradation time. The Bio-Absorbable Implants completely adsorbed within the bone tissue and the degradation proceeds. Newer Bio-Absorbable polymers offer reduced incidence of side effects along with more resorption time parameters. The commercially available Bio-Absorbable implant includes pins and screws. They are more tensile and flexible when compared to traditional implants with easy adoption.
