Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bio-based Polytetramethylene Ether Glycol (BioPTMEG) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PTMEG is a homopolymer obtained by cationic ring-opening polymerization of tetrahydrofuran (THF) monomer. It is a linear polyether diol with primary hydroxyl end groups. It is a white waxy solid at room temperature and a transparent, colorless liquid after melting. The average molar mass of PTMEG is about 1000~2000g/mol, and the degree of polymerization is relatively low. It does not belong to synthetic resins and synthetic fibers. PTMEG is mainly used to produce spandex and polyurethane elastomers. With the rapid development of spandex and polyurethane industries, the demand for PTMEG at home and abroad continues to increase, showing a wide range of application prospects. Non-food bio-based PTMEG is made of furfural extracted from corn cobs/straw as raw material. Compared with traditional petroleum-based PTMEG, it can reduce raw material costs by more than 30% and reduce carbon emissions by 40%. Many large chemical companies around the world are committed to the research of bio-based PTMEG technology, considering using cheap, abundant, non-food biomass waste such as corn cobs and straw as starting materials to produce high-value chemical products such as PTMEG.

The global Bio-based Polytetramethylene Ether Glycol (BioPTMEG) market size was estimated at USD 1363.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
