### Report Overview

Currently, there are four methods for the development of soybean-based adhesives. The first one is the addition of soybean flour to the synthetic adhesives that reduces consumption of the synthetic adhesives. The second method is the use of soy flour as an extender in the PF resins for plywood manufacturing. The third method is the denaturation of soy proteins. The soybean protein is first denatured under various conditions and chemicals and is later used as adhesives. The fourth method is by the usage of cross-linking agent for curing soybean protein and is later used as an adhesive.

Bio-based adhesives are finding increasing applications in the packaging sector, majorly for PET container packaging, flexible packaging, corrugated boards, carton side seams, and film-foil laminates. Flexible packaging is the second-largest packaging application segment of the overall packaging market, owing to various advantages, such as requiring 91% less material than rigid packaging, and about 96% of space saving. In the food industry, flexible packaging is being largely preferred due to its moisture absorption properties, product freshness, and temperature control while maintaining the shelf life of the product.
