Abstracts

The Bio-Carrier is typically a material with a large specific surface area and favorable bioadhesive properties, such as high concentration powder carriers. These carriers can enrich microorganisms at the surface to improve the amount of biomass in the bioreactor. Biofilm reactors are one of the most important technologies being widely used in wastewater treatment plants. Similar to activated sludge systems, they can provide organic matter removal, nitrification, denitrification and phosphorus removal. Bio-carriers, one of the key components used in wastewater treatment, can enrich microorganisms at the surface to improve the amount of biomass in the reactor. Currently, there are many types of available bio-carriers having different shapes and sizes; they are made of polyethylene, polypropylene or high-density polyethylene with a typical density slightly less than water. To obtain better organic matter removal and to improve mass transfer efficiency in reactors, multiple research projects involving bio-carriers have been conducted.

The global Bio-Carrier market size was estimated at USD 402.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Bio-Carrier market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
