Report Overview

Bio-herbicides consist of phytotoxins, pathogens, and other microbes used as biological weed control. Bio-herbicides may be compounds and secondary metabolites derived from microbes such as fungi, bacteria or protozoa; or phytotoxic plant residues, extracts or single compounds derived from other plant species.

The awareness about bio-herbicide is on the rise among the consumers as an increasing number of people are becoming aware of the hazardous effects of synthetic chemicals on the ecosystem. Also, the evolution of stringent regulatory norms against the use of synthetic chemicals and the phasing out of certain active ingredients, such as glyphosate, in many countries are further accelerating the market for bio-herbicides. Low prices of synthetic herbicides are expected to remain a key challenge for its penetration in the global market. Additionally, chemical based herbicides are known to show better results on account of which farmers tend to use them more than bio-herbicides. Lack of awareness among the farmers is also anticipated to restrain the industry development in the near future. Integration of bio-herbicides with chemical herbicides increases the impact of bio based products on weed and helps in enhancing the process efficiency. The consumption of bio-herbicides is high in North America due to the growing demand for crop protection chemicals in the ornamental horticulture sector. The rise in environmental safety concerns and increase in organic farming will continue to boost the demand for bio-herbicides in the region throughout the forecasted period.
