### Report Overview:

The use of bio-based materials as food packaging materials is on a continuous rise, owing to their advantages over fossil-based plastics, such as use of renewable resources in their production and, in many cases, the biodegradability and/or compostability of the finished product, which offers an alternative to disposal in landfills. The most common bio-based plastic synthesized from bio-based monomer is polylactic acid.

PLA is an aliphatic polyester produced by the polymerization of lactic acid (2-hydroxypropionic acid). Lactic acid can be produced synthetically from hydrogen cyanide and acetaldehyde, or naturally by anaerobic fermentation by bacteria or certain fungi of carbon substrates, either pure (e.g., glucose and sucrose) or impure (e.g., starch). Bio-PLA films can hold creases or twists, a property normally lacking in plastic films. The physical properties of PLA make it an ideal candidate for replacement of fossil-based plastics in several application areas of low-density polyethylene (LDPE), high-density polyethylene (HDPE), polypropylene (PP), and polyethylene terephthalate (PET).

The Global Bio-polylactic Acid (PLA) Films Market Size was estimated at USD 541.09 million in 2023 and is projected to reach USD 868.22 million by 2029, exhibiting a CAGR of 8.20% during the forecast period.
