Report Overview

Bio-Therapeutic Glycoproteins are bioactive compounds with carbohydrates attached to proteins. Glycan is the specific site where carbohydrate attaches to proteins and process of production is called glycosylation. Bio-therapeutic glycoproteins produced with glycan moieties that are similar to natural mammal glycans. The most common types are glycosylation O-linked and N-linked that are mainly depends on protein sequence attachment. Carbohydrates linked to proteins through either α and β linkages. Glycosylation is an important process of bio-therapeutic glycoproteins because it is critically modulated into bioactivity, stability, solubility against proteolysis, yield, clearance rate from circulation and immunogenicity. The bio-therapeutic glycoproteins mainly produced by yeast expression systems, insect cells, mammalian systems, and plant-based expression systems. In yeast expression systems, yeast is cultured chemically to scale up fermentation to an industrial level. Yeast and human share same N-glycan's linkage. Insect cells represent an alternative system for expression of recombinant bio-therapeutic proteins. Later recombinant proteins are separated from insect cells. Mammalian Systems are used to produce complex bio-therapeutic glycoproteins. Most of the FDA approved bio-therapeutic glycoproteins derived from mammalian systems. Plant-based expression systems used for the scale-up production of glycoproteins. Among all systems, mammalian systems are well established in pharmaceuticals. Some examples of bio-therapeutic glycoproteins include tocilizumab, bevacizumab, adalimumab, etc.

The potential benefits of Bio-Therapeutic Glycoproteins have been a subject of rising industrial interest in the context of wide range application. So, far they include several protein classes like antisera, cytokines, clotting factors, hormones, enzymes and enzyme inhibitors have been best suited physiologically. The trend of industrial developments likely continues alongside with growing knowledge about the functions of

bio-therapeutic glycoproteins. Bio-Therapeutic Glycoproteins are a fastest growing field in the pharmaceutical industry due to a wide range of applicability. The mammalian expression system is used to produce glycoproteins that coded with human-like glycans. Bio-Therapeutic glycoproteins represent an integrated treatment for most of the autoimmune disorders, cancers, replacement therapies like hormone and enzyme substituted. All these benefits of glycoproteins drive the robust growth of the Bio-Therapeutic Glycoproteins market.
