Abstracts

Bioabsorbable materials, also known as biodegradable or resorbable materials, are substances designed to be gradually absorbed, metabolized, and eliminated by the body after fulfilling their intended function, eliminating the need for surgical removal or long-term presence. These materials—which include polymers like polylactic acid (PLA), polyglycolic acid (PGA), and their copolymers, as well as certain metals (e.g., magnesium alloys) and ceramics—are engineered to degrade at controlled rates matching the healing or regeneration process of tissues. They are predominantly used in medical applications such as sutures, orthopedic fixation devices (screws, pins, and plates), cardiovascular stents, drug delivery systems, and tissue engineering scaffolds, where temporary mechanical support or localized therapy is required before the material safely breaks down into biocompatible byproducts. The key advantages driving their adoption include reduced risk of long-term complications (e.g., inflammation, implant rejection, or secondary surgeries), improved patient outcomes, and alignment with minimally invasive treatment philosophies.

The global Bioabsorbable Material market size was estimated at USD 3425.67 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.85% during the forecast period.
