## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bioactive Granular Fertilizer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of bioactive granular fertilizers reached 4.76 million tons, with an average global price of \$775 per ton in 2024. Bioactive granular fertilizers are compound fertilizers made from organic materials (such as animal and plant residues and microbial fermentation products) supplemented with microbial agents with specific functions (such as phosphate-solubilizing bacteria, nitrogen-fixing bacteria, and *Bacillus subtilis*) and nutrients through a granulation process. Their core principle is to spatially integrate organic matter, microorganisms, and nutrients through granulation technology, maintaining microbial activity while enhancing ease of application. The slow-release properties of organic materials also extend the nutrient supply cycle and reduce nutrient loss. This type of fertilizer significantly improves fertilizer utilization efficiency (15%-30% higher than traditional fertilizers) by activating soil microbial metabolism, improving soil aggregate structure, and promoting the conversion of insoluble nutrients (such as phosphorus and potassium). It also repairs degraded soils and reduces non-point source pollution, meeting the needs of ecological agriculture.

The global Bioactive Granular Fertilizer market size was estimated at USD 3707.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
