Report Overview:

Bio-adhesives is a natural polymeric material which is used as adhesives (substance applied to the surfaces of materials that binds them together and resists separation) between two separate materials. Bio-adhesives are mostly used to describe glue which is used to bind the substance and resist separation between two materials. Glue is synthetically (execution of chemical reactions to obtain a product) formed by using biological monomers (molecule that is used to chemically bind two molecules to form a polymer) such as sugars or by any synthetic material designed to adhere to biological tissue. Bio-adhesives materials have the property to build durable interface between two classes of materials such as hard and soft materials, which are of disparate scale and exhibit certain characteristic which makes them different from synthetic adhesives. Protein and carbohydrate are the major substances used to make bio-adhesives. Proteins (gelatin) and carbohydrates (starch) have been used as general-purpose glues by general public since ages.

The Global Bioadhesives Market Size was estimated at USD 3607.70 million in 2023 and is projected to reach USD 6567.56 million by 2029, exhibiting a CAGR of 10.50% during the forecast period.
