Abstracts

Biobased polyesters are a large class of bioplastics that are derived from renewable resources such as natural fats and oils. Some biobased polyesters that have gained commercial use or that are currently investigated for commercial use include polylactic acid (PLA), polyglycolic acid (PGA), poly- ϵ -caprolactone (PCL), polyhydroxybutyrate (PHB), and poly(3-hydroxy valerate). Among these, PLA is the most extensively studied biodegradable thermoplastic polyesters. It is truly biodegradable and biocompatible polyester with a relatively high melting point (160 °C). Composites include fiber-reinforced materials and organic matrices, with the most commonly used materials being Glass Fiber Reinforced Polymer (GFRP) and Carbon Fiber Reinforced Polymer (CFRP) composites, followed by composites reinforced with aramid or natural fibers. After a decline in production in 2020, the global composites industry is gradually returning to pre-pandemic growth rates, with the energy, electronics/electrical, construction, marine and consumer goods markets showing rapid recovery. New growth opportunities are also emerging in emerging sectors such as electric and hydrogen-fueled vehicles, marine, sports and recreation, medical, electrical and electronics, oil and gas, furniture and design, defense and security, and renewable energy. Between now and the future, composites will provide higher performance, lighter, more energy efficient as well as more durable products in a wider range of applications and markets.

The global Biobased Polyester Fiber market size was estimated at USD 2445.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
