## Abstracts

Biocement is an innovative construction material created through biological processes, often involving microorganisms to enhance soil stability or bind materials together. The primary principle behind biocement is the use of biogeochemical processes, such as microbial-induced calcite precipitation (MICP), in which bacteria produce calcium carbonate as a byproduct of their metabolic activity. This calcium carbonate can then fill the pores between soil particles or bind aggregates, resulting in improved strength and durability.

The global Biocement market size was estimated at USD 864.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
