### Report Overview

A cellulose sponge, as its name connotes, is made of cellulose (the material that makes up the walls of a plant cell) mixed with hemp fibers and sodium sulphate crystals, environmentally friendly and biodegradable. It's heated up, cut to size, bleached, and rinsed. For the most part, these sponges are just like non-cellulose alternatives. That includes plastic sponges and other products and materials manufactured and marketed for similar purposes. Crucially, cellulose sponge is hydrophilic. Hydrophilic materials attract water. As water and other liquids spread across their surfaces, contact is maximized by the random-celled nature of the material. The result is excellent absorbency. It's the main reason cellulose sponges are most extensively employed in the cleaning products industry.

The global Biodegradable Cellulose Sponge market size was estimated at USD 2201 million in 2023 and is projected to reach USD 2999.74 million by 2032, exhibiting a CAGR of 3.50% during the forecast period.
