Report Overview

Biodegradable films are plastic based films that have additives included in the manufacturing process. These additives, usually enzymes, enable the plastic to break down. When the film breaks down, it simply turns into smaller pieces of plastic. Therefore, biodegradable films aren't as environmentally friendly as they're cracked up to be. Biodegradable plastics also require specific conditions to break down, such as sunlight or certain temperatures. This means they can still take years (even decades) to break down and can leave behind micro-fragments of plastic. Plus, they can sometimes emit CO₂ when they're decomposing, which isn't ideal.

The global Biodegradable Films market size was estimated at USD 1169.80 million in 2023 and is projected to reach USD 1943.04 million by 2032, exhibiting a CAGR of 5.80% during the forecast period.

North America Biodegradable Films market size was estimated at USD 335.88 million in 2023, at a CAGR of 4.97% during the forecast period of 2024 through 2032.
