Abstracts

Biodegradable monofilament refers to a type of single-strand fiber, typically used in applications such as fishing lines, agricultural nets, medical sutures, and textiles, that is engineered to break down naturally in the environment through biological processes, such as microbial action, into non-toxic components like water, carbon dioxide, and biomass, thereby reducing persistent plastic pollution and environmental harm compared to conventional petroleum-based monofilaments; these materials are commonly derived from renewable sources like polylactic acid (PLA), polyhydroxyalkanoates (PHA), or other bio-based polymers, and their decomposition rates and mechanical properties?such as tensile strength, flexibility, and durability?are carefully tailored to meet specific functional requirements while ensuring compliance with international biodegradability standards.

The global Biodegradable Monofilament market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
