Abstracts

Biodegradable nonwovens are engineered fabrics made from natural or synthetic polymers that can decompose into natural elements like water, carbon dioxide, and biomass within a defined timeframe under specific environmental conditions, typically through microbial action. These materials are produced using fibers derived from renewable sources such as polylactic acid (PLA), cellulose, starch-based polymers, or other compostable synthetics, and they are manufactured through processes like spunbond, meltblown, or wet-laid techniques to achieve desired properties like absorbency, strength, or barrier performance. Unlike conventional nonwovens that persist in the environment, biodegradable variants are designed to break down in industrial composting facilities, soil, or marine settings, reducing plastic pollution and aligning with circular economy principles, though their functionality and degradation rates depend on material composition, additives, and disposal environments.

The global Biodegradable Nonwovens market size was estimated at USD 1567.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
