Abstracts

Biodegradable plasticizers are specialized chemical additives incorporated into polymer matrices, particularly bioplastics and conventional plastics, to enhance flexibility, durability, and processability while ensuring the final product can decompose through natural biological processes, such as microbial action, into non-toxic byproducts like water, carbon dioxide, and biomass. These substances are designed as eco-friendly alternatives to traditional phthalate-based or other persistent plasticizers, addressing environmental and health concerns associated with plastic pollution and endocrine disruption. Common types include citrate esters, adipates, sebacates, and epoxidized vegetable oil-based derivatives, which are compatible with polymers like polyvinyl chloride (PVC), polylactic acid (PLA), and polyhydroxyalkanoates (PHA), supporting applications in packaging, medical devices, agricultural films, toys, and textiles where sustainability and reduced ecological impact are prioritized.

The global Biodegradable Plasticizer market size was estimated at USD 1850.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.15% during the forecast period.
