Abstracts

Biodegradable skin fillers represent a class of injectable medical aesthetic products used to temporarily correct facial wrinkles, restore lost volume, and enhance facial contours by introducing materials that are naturally broken down and absorbed by the body over time. These fillers are distinguished by their biocompatibility and temporary nature, with common formulations including hyaluronic acid (HA), calcium hydroxylapatite, poly-L-lactic acid (PLLA), and more recently emerging options like collagen-stimulating polymers or biosynthetic gels. The primary appeal lies in their ability to deliver natural-looking, reversible results with a favorable safety profile compared to permanent alternatives, as their degradation process aligns with the body's metabolic pathways, minimizing long-term complications and allowing for adjustments as facial aging progresses.

The global Biodegradable Skin Filler market size was estimated at USD 1240.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.85% during the forecast period.
