Abstracts

Biodegradable sunscreen is a type of sun - protection product formulated with ingredients that can break down naturally into simpler, non - harmful substances through biological processes such as the action of microorganisms in the environment. Unlike traditional sunscreens that may contain persistent chemicals, biodegradable sunscreens are designed to minimize environmental impact. Their active ingredients often include natural substances like plant - derived extracts, minerals such as zinc oxide or titanium dioxide, and other biodegradable compounds. These sunscreens not only provide effective protection against the sun's harmful ultraviolet (UV) rays for the skin but also contribute to the preservation of ecosystems, especially in sensitive areas like water bodies where non - biodegradable sunscreen residues can accumulate and harm aquatic life.

The global Biodegradable Sunscreen market size was estimated at USD 1273.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
