## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Biodegradable Wearable Batteries competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of biodegradable wearable batteries reached approximately 68.5 million units, with an average global market price of around US\$20 per unit. Based on roll-to-roll flexible battery production speeds and wearable cell footprints (~30?55 mm), a single dedicated line can output ? 1.2 million units/year assuming two shifts and ~85% uptime. Using the ASP of US\$50 and typical battery cost splits (materials ?50%, processing ?30%), the indicative gross margin is ~40% (implied COGS ? US\$30/unit). Illustrative cost structure: materials ~52% (zinc/manganese or other biodegradable electrodes, biopolymer/cellulose separators, hydrogel electrolytes), processing ~32% (printing/lamination/drying/QA), test/pack/logistics ~9%, depreciation/overhead ~7%. Biodegradable wearable batteries are batteries designed for wearable devices where the constituent materials (such as electrodes, electrolytes, separators, etc.) can decompose naturally in the environment without leaving harmful residues, while also possessing flexibility, lightweight, and safety required for devices worn on the body and undergoing mechanical deformations.

The global Biodegradable Wearable Batteries market size was estimated at USD 1370.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.40% during the forecast period.
