Report Overview:

Biodiesel is an alternative fuel for diesel engines that is produced by chemically reacting a vegetable oil or animal fat with an alcohol such as methanol or ethanol.

The chemical reaction used to make biodiesel requires a catalyst. A catalyst is usually a chemical added to the reaction mixture to speed up the reaction. Since the catalyst is not consumed in the reaction, it will be left over at the end in some form. In biodiesel production, the actual compound that catalyzes the reaction is called methoxide. One common way to make methoxide is to dissolve sodium hydroxide or potassium hydroxide in methanol. Large producers buy a solution of sodium methoxide in methanol that is much safer to work with.

In this report, we research all biodiesel catalyst including hydroxide, sodium methylate solution and other.

The Global Biodiesel Catalyst Market Size was estimated at USD 415.93 million in 2023 and is projected to reach USD 449.44 million by 2029, exhibiting a CAGR of 1.30% during the forecast period.
