Abstracts

Made from renewable biomass, including plants, algae, and organic waste, biofuels address the issue of limited fossil - fuel resources. Biofuel solutions refer to a series of measures and technologies aimed at the production, application, and promotion of biofuels. First-generation biofuels: Made from food crops like corn and sugarcane, examples include bioethanol and biodiesel. They are a transitional fuel, meeting current sustainability and carbon - footprint - reduction criteria. Second-generation biofuels: Derived from organic waste such as agricultural and forestry waste, used cooking oil, and urban organic waste. This type includes renewable diesel, sustainable aviation fuel, biogas, and biomethane, which promotes resource reuse and reduces landfill waste. Third-generation biofuels: Extracted from algae and aquatic plants with high oil content. Although not yet commercially produced, they have the potential for high-efficiency production. Fourth-generation biofuels: Involve genetically modifying microorganisms to improve the efficiency of CO₂ capture and storage. There are currently pilot plants in Brazil and the United States. Biofuels help reduce CO₂ emissions as the CO₂ released during combustion is equal to that absorbed by the raw materials during growth. They also produce fewer pollutants compared to fossil fuels, contributing to improved air quality. The local production of biofuels enhances a country's energy security and independence, reducing reliance on imported fossil fuels. Utilizes waste materials, such as agricultural and forestry residues, and used cooking oil, promoting the development of the circular economy.

The global Biofuel Solutions market size was estimated at USD 5935.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
