Abstracts

Biogas scrubbing systems are specialized purification units designed to remove contaminants?primarily hydrogen sulfide (H₂S), carbon dioxide (CO₂), siloxanes, moisture, and other trace impurities?from raw biogas produced through anaerobic digestion of organic matter, enabling its upgrade to biomethane that meets pipeline injection standards or vehicle fuel specifications. These systems employ various technologies, including chemical absorption (e.g., amine scrubbing), physical absorption (e.g., water or organic solvent scrubbing), pressure swing adsorption (PSA), membrane separation, and biological desulfurization, each tailored to specific input gas compositions, output purity requirements, and economic considerations. The primary function is to enhance biogas calorific value, prevent equipment corrosion, reduce emissions, and facilitate compliance with regulatory standards for renewable natural gas (RNG) utilization across energy, transportation, and industrial applications.

The global Biogas Scrubbing Systems market size was estimated at USD 780.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
