Report Overview

Biogas Upgrading refers to the process of converting raw biogas, primarily composed of methane, carbon dioxide, and other trace gases, into a purer form of biomethane. This is achieved through various technological methods such as pressure swing adsorption, membrane separation, or chemical absorption, which remove impurities and increase the methane content to a level suitable for use as a renewable natural gas (RNG) in the natural gas grid or as a vehicle fuel. The upgraded biogas, now biomethane, has a higher energy content and lower greenhouse gas emissions compared to the original biogas, making it a more environmentally friendly and efficient energy source. This process is crucial for the utilization of biogas in various applications, enhancing its marketability and contributing to the transition towards a more sustainable energy system.
