### Report Overview

Biogenerics drugs are the biological products manufactured after end of patent of innovator biopharmaceuticals. Biogenerics also known as biosimilars in Europe, follows-on-biologics in US and subsequent entry biological in japan. Due to their high degree of similarity with the biological reference product, they have no clinically evidenced and meaningful differences from the reference product in terms of quality, safety or efficacy. Biogenerics drugs provide effective treatment for number of serious and life-threatening illness because of their high specificity and activity. Biogeneric are more complex compared to small molecule drugs. Their quality and safety are highly dependent on the process of production (choice of cell type, development of the genetically modified cell for production, etc.), purification and formulation. The constitution of the biogeneric drugs can be either small molecules such as human insulin or erythropoietin, or complex molecules such as monoclonal antibodies. Biogeneric drugs are increasing gaining prominence given the loss of exclusivity of big branded drugs. In Europe, biogenerics can be marketed through independent applicant following expiry of patent and market exclusivity periods of the reference product. Regulatory harmonization, naming and labelling, innovative licensure norms and route to market for the biogeneric drugs are issues expected to gain attention and traction from big drug makers in the forthcoming years.
