Abstracts

BLI technology projects a beam of visible light onto the biofilm layer on the sensor surface through a fiber optic biosensor. When the target molecule (such as protein, nucleic acid or drug) binds to the ligand (fixed molecule) at the end of the sensor, the thickness and density of the biofilm layer change at the nanoscale, causing interference displacement of the reflected light wave. The molecular interaction analyzer based on bio-layer interferometry (BLI) is a revolutionary bioanalysis tool that achieves precise quantitative research on the binding process of biomolecules by real-time monitoring of the optical signal changes of molecular interactions.

The global Biolayer Interferometry (BLI) System for Molecular Interaction Analysis market size was estimated at USD 105.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
