Abstracts

Biological assets valuation refers to the process of determining the fair market value of living plants and animals, such as timber forests, dairy cattle, aquaculture stocks, or agricultural crops, which are held for agricultural activity. This valuation is governed by accounting standards, primarily IAS 41 (Agriculture), which requires biological assets to be measured at fair value less costs to sell at each reporting date, unless fair value cannot be measured reliably. The approach integrates both market-based and income-based valuation methods, considering factors like growth stages, yield potential, market prices for harvested produce, and production costs, while also accounting for biological transformation?such as growth, procreation, and degeneration?that affects value over time. Accurate valuation is critical for financial reporting, investment analysis, risk management, and regulatory compliance, especially for entities in agribusiness, forestry, and aquaculture sectors.

The global Biological Assets Valuation market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
