## Abstracts

Biological buffering agents are substances that help maintain a stable pH in living systems by neutralizing excess acids or bases, thereby ensuring optimal conditions for biochemical processes. They play a vital role in maintaining homeostasis within cells and bodily fluids, where even slight changes in pH can disrupt enzyme activity and metabolic functions. Common biological buffers include the bicarbonate system in blood, the phosphate buffer system in cells, and protein buffers like hemoglobin. In laboratory settings, synthetic buffers such as Tris, HEPES, and PBS are frequently used to mimic physiological conditions and support experimental accuracy.

The global Biological Buffering Agents market size was estimated at USD 1437.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
