Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Biological Inactivated Vaccine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Inactivated biological vaccines refer to a type of vaccine that uses physical or chemical methods (such as heat treatment, formaldehyde, β -propiolactone, etc.) to completely kill pathogenic microorganisms (such as viruses, bacteria, etc.), making them lose their infectivity and pathogenicity, while retaining their main antigenic structure to induce the body to produce a specific immune response. This type of vaccine is highly safe and suitable for people with weak immunity. It is widely used to prevent hepatitis A, polio, rabies, new coronavirus and other infectious diseases.

The global Biological Inactivated Vaccine market size was estimated at USD 892.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
