Report Overview

The ionization methods of commercial biological mass spectrometers are mainly electrospray ionization and matrix-assisted laser desorption ionization. The former often uses a quadrupole mass analyzer. The instrument is called an electrospray (quadrupole) mass spectrometer (ESI-MS), the latter often uses time-of-flight as a mass analyzer, and the instrument is called matrix-assisted laser desorption ionization time-of-flight mass spectrometer (MALDI-TOF-MS). One of the characteristics of ESI-MS is that it can be used in conjunction with modern separation methods such as liquid chromatography and capillary electrophoresis, thereby greatly expanding its range of applications in life sciences, including drug metabolism, clinical and forensic applications, etc.; MALDI- The characteristics of TOF-MS are its high tolerance to salts and additives, and its rapid sample measurement and simple operation. In addition, mass spectrometers that can be used for the measurement of biological macromolecules also include ion trap (IT) mass spectrometry and Fourier transform ion cyclotron resonance (FTICR) mass spectrometry. The latest biomass spectrometers on the market are liquid chromatography-electrospray-quadrupole time-of-flight tandem mass spectrometry (LC-ESI-MS-MS) and MALDI-TOF mass spectrometer with tandem mass spectrometry. The former is Based on the traditional electrospray mass spectrometer, a time-of-flight mass analyzer is used instead of the quadrupole mass analyzer, which greatly improves the resolution, sensitivity and quality range of the instrument. Its trade names are Q-TOF and Q-STAR. The latter is to add post-source decay (PSD) mode or collisionally induced dissociation (CID) mode to mass spectrometry, which makes it possible to sequence biological macromolecules.
