Abstracts

Biological silage additives are microbial inoculants, enzymes, or combination products applied to forage crops during the ensiling process to improve fermentation quality, enhance aerobic stability, reduce dry matter losses, and inhibit undesirable microbial activity. These additives typically consist of lactic acid bacteria, such as *Lactobacillus plantarum* or *Pediococcus* species, which accelerate pH drop, or enzymes like cellulases and hemicellulases that break down plant fibers to release fermentable sugars. The market is driven by the global demand for high-quality animal feed, the need to reduce spoilage and nutrient loss in silage, and growing awareness among livestock producers about feed efficiency and animal health.

The global Biological Silage Additives market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
